

Cross-timeframe meta-analysis — best regimes & strategies

Symbol: EURUSD
Bars per timeframe run: 12,000
Timeframes (minutes): 15m (M15), 30m (M30), 60m (H1), 120m (H2), 240m (H4)
Min trades per row to qualify: 5

Method (descriptive — not a formal hypothesis test):

1. Per timeframe: each row is one of 208 regime×strategy specs. `rank\_score` blends wr_1r..wr_4r (MFE ≥ kR before ATR stop) and lightly penalizes trades < 8 (same as per-regime PDF).
2. Per (regime, timeframe): among strategies with trades ≥ min_trades, select the strategy with highest rank_score (argmax). That is one discrete choice out of four candidates.
3. Cross-timeframe: for each regime, take the rank_score of that winner on each TF where a winner exists. Report median / mean / std across TFs— a simple robustness read. `dominant_winner_*- 4. Pairs table: for each fixed (regime_id, strategy_key), require trades ≥ min_trades on each TF row, then aggregate median rank_score across TFs. Useful when the best regime should stay on one named playbook across horizons.
- 5. Search space: 52 regimes × 4 strategies × len(timeframes) evaluated— reports compress this with medians and modes, not exhaustive enumeration.

Top regimes by median best-strategy rank_score across TFs (min_trades=5)

regime_id	regime_name	quadrant	median_best_rank	mean_best_rank	std_best_rank	n_tf	mean_wr2_of_winner	dominant_winner_key	dominant_winner_title
